

SCHAEFFLER

Schaeffler Aerospace Standard Products
We pioneer motion

Foreword

Schaeffler Aerospace

We are committed to joint development partnerships with technology leaders in the aviation and aerospace industry. The products of Schaeffler Aerospace meet the highest quality standards according to AS9100. Our customers are world renowned manufacturers or airplanes, landing gears, passenger seats, cargo solutions, actuation systems, and other equipment parts.

Our products are used in a wide range of applications in the aerospace industry. Our worldwide customer base, which includes all the renowned manufacturers of aircraft engines, helicopters, turbo-pumps, space systems, and parts of the medical technology sector, not only appreciates the quality of the products we manufacture, but it also respects our innovative solutions for new developments. We are a system supplier of highly reliable special bearing supports, both in terms of the materials used and the design. In addition to the development of special bearings, Schaeffler Aerospace offers complex and highly integrated bearing systems and electromechanical units including the relevant sensor systems.

Your benefits:

- Highest Aerospace quality standards
- Cost savings by using standard production
- Short delivery times
- Wide product range
- Customized products
- High delivery performance
- More than 50 years of Aerospace expertise
- Direct communication with customer service

Certifications

Schaeffler Aerospace is certified from the following civil aviation authorities:

- AS9100
- EASA
- FAA
- CAAC
- TCCA
- Nadcap

Foreword

Standard Products

Schaeffler Aerospace Standard Products are manufactured in Schaeffler Industrial plants and used in aviation applications. These parts are classified in categories (CAT 0 to CAT 4) according to their possible hazard potential in a case of impaired function or failure. The risk categories of the following Commodity Products are CAT 0 - CAT 2.

- | | |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CAT 0 | ■ Parts in subordinate functions that do not compromise the success of the flight or mission |
| CAT 1 | Parts, the failure of which is unlikely to cause:
■ Termination of the flight or
■ Failure of the device (slight impairment of function, ancillary drive outputs, accessory equipment) |
| CAT 2 | Parts, the failure of which is likely to cause:
■ Termination of the flight or
■ Failure of the device (significant impairment of function, ancillary drive outputs, accessory equipment) |

Spherical plain bearings and rod ends

Spherical plain bearings are ready-to-fit precision machine elements. Due to the outer ring with its concave inner slideway and the inner ring with its curved outer slideway, they can perform spatial adjustment motions. The bearings can support static loads and are suitable for tilt and swivel motion. They can compensate for shaft misalignment, are not subject to edge stresses under misalignment and allow substantial manufacturing tolerances in the adjacent construction.

Rod ends are spherical plain bearing units. They comprise a housing and integral shank, into which a spherical plain bearing is integrated, and have an external or internal thread. Rod ends are used as connecting levers and connecting rods and as connecting elements between cylinders and their adjacent parts in hydraulic and pneumatic cylinders.

Spherical plain bearings and rod ends are available in numerous designs, dimension series and versions. They have high operational security and a long operating life. Maintenance-free versions are available with the sliding layers ELGOGLIDE, PTFE composite and PTFE film. Versions requiring maintenance have steel/steel or steel/bronze sliding contact surfaces and can be easily relubricated.

Plain bushes, thrust washers and strips

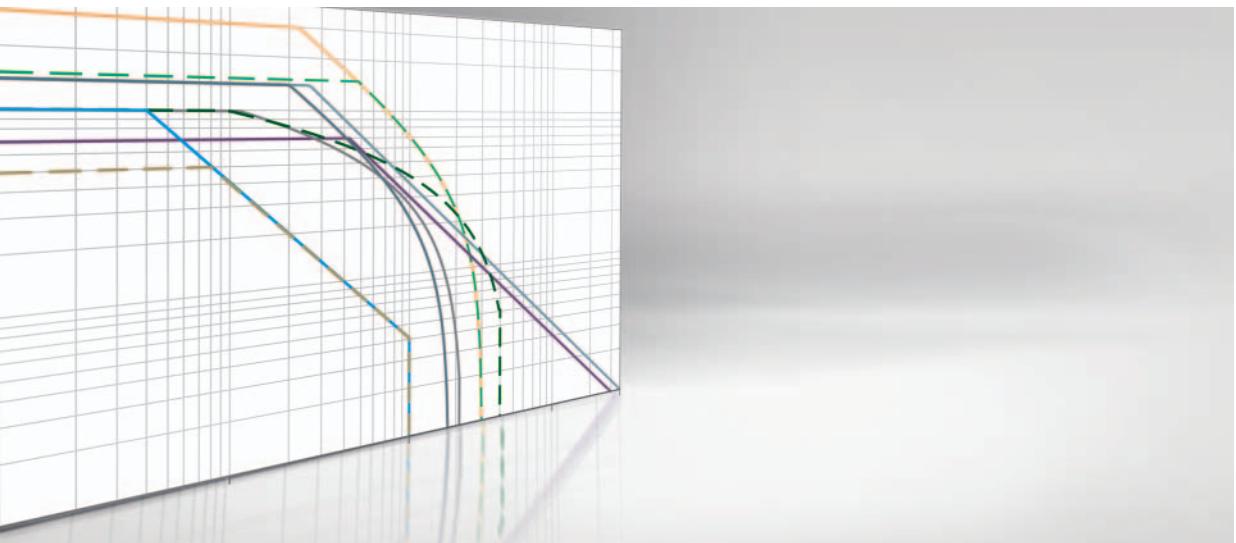

Plain bushes, thrust washers and strips are used not only for rotary and oscillating motion but also for linear motion with short or long stroke lengths. In the case of maintenance-free bearings with the sliding material E40, lubrication is not necessary at any point during the operating life due to the use of PTFE as a dry lubricant. The low-maintenance bearings with the sliding material E50 receive an initial lubrication at the start of operation. Since the sliding layer has lubrication pockets, this initial lubrication is sufficient in most cases.

All metal/polymer composite plain bearings are free from lead in accordance with the End of Life Vehicles Directive, Directive 2000/53/EC as well as the Directive 2011/65/EU (RoHS-II) for the restriction of hazardous substances. They are thus environmentally safe.

In addition to the polymer composite plain bearings with the sliding materials E40 and E50, there are also plain bushes with ELGOGLIDE and ELGOTEX filament wound bushes.

Selection of the correct plain bearing

Areas of application

Plain bearings from Schaeffler are used under high specific loads and various possible types of motion, from swivel type motion to overlaid motion. They are ideally suited to intermittent operation occurring on a periodic or non-periodic basis.

The plain bearings are bearings for very small radial or axial design envelopes where high load carrying capacity is nevertheless required. They can also be used under vibration coinciding with small amounts of motion. The bearings offer excellent damping characteristics especially under static loading, such as those required under shock loads.

Many of the plain bearings are destined for maintenance-free applications and in cases where long rating values are required.

Requirements of the application

Plain bearings from Schaeffler are available in various bearing types, designs and sizes as well as with different plain bearing materials.

Selection of the suitable bearing is dependent principally on the requirements of the application. These include:

- load conditions
 - type of load
 - direction of load
 - magnitude of load
- motion conditions
 - type of motion
 - direction of motion
 - frequency of motion
- adjacent construction
 - available design envelope
 - shaft, housing
- rating life requirement
- environmental influences
 - temperature
 - influence of media
 - contamination
 - lubrication.

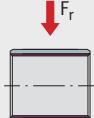

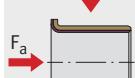

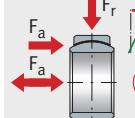

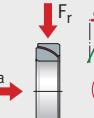

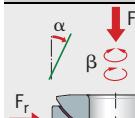

Selection of the correct plain bearing

Selection by bearing type

Depending on the type of plain bearing and the typical geometrical structure in the particular case, there are different possibilities for support of load and degrees of freedom of motion. Some bearing types facilitate additional functions such as the compensation of angular misalignment, see table.

Selection of the suitable spherical plain bearing for combined load is dependent on the ratio between the radial and axial force. Further information see HG 1, Plain Bearings.

Support of load and degrees of freedom of motion

Bearing type	Load			Motion			Compensation of angular misalignments

	■	■	-	■	■	-	■

Sizes of bearing types

The catalogue range of plain bearings from Schaeffler covers a range of shaft diameters from 3 mm to 1000 mm, see table. The size required is dependent principally on the adjacent construction and the loads to be supported.

For an initial estimate of the size of spherical plain bearing required, predimensioning can be carried out, see page 14.

Shaft diameters in catalogue range

Bearing type	Shaft diameter	
	min. mm	max. mm
Bushes	3	300
Flanged bushes	6	40
Radial spherical plain bearings	6	320
Large radial spherical plain bearings	220	1 000
Rod ends	5	80
Hydraulic rod ends	10	200
Thrust washers	10	62
Angular contact spherical plain bearings	25	200
Axial spherical plain bearings	10	360

Selection of the correct plain bearing

Selection by material suitability

The various bearing types are available in different material combinations, see table. The suitable material will depend on the required performance capability and the environmental influences.

Based on the specific material combinations, bearing solutions can be achieved that are maintenance-free, low-maintenance or that require maintenance, see table.

Operating limits of plain bearing materials

The suitability of a plain bearing material can be estimated from the particular operating limits of the specific bearing load, *Figure 1*.

Further operating limits are determined from the comparison of sliding velocity, see table, page 12, the pv diagram, *Figure 2*, page 12, the temperature resistance, *Figure 3*, page 12, and the coefficient of friction.

Schaeffler recommends the use of the sliding layer ELGOGLIDE under dynamic bearing loads in the range from 25 N/mm^2 to 300 N/mm^2 .

The sliding layer ELGOGLIDE-W11 should be used in preference in the range from 1 N/mm^2 to 100 N/mm^2 . If the specific load is outside these ranges, the other ELGOGLIDE sliding layer is recommended.

For static loads of more than 180 N/mm^2 , the design of ELGOTEX filament wound bushes must be checked by the Schaeffler engineering service. For loads at or over this range, we alternatively recommend the use of ELGOGLIDE plain bushes.

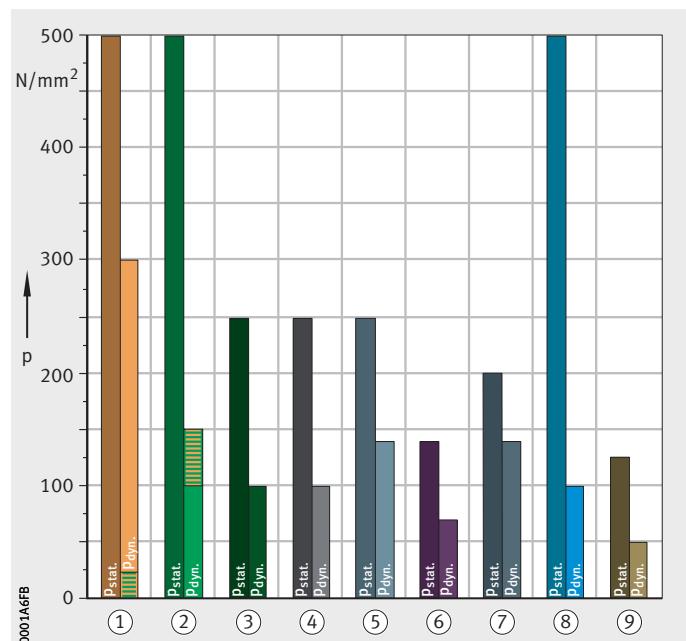

The actual load carrying capacity of a plain bearing is dependent on the material of the sliding layer and the supporting body as well as on the bearing geometry and the adjacent construction. The data and guidelines in the product chapters must be observed.

Estimation of the sliding distance

If the rating life is the decisive selection criterion, a simple estimate of the achievable sliding distance can be made for maintenance-free and low-maintenance plain bearings. The sliding distance s is the distance covered by the mating body along the sliding surface. The failure mechanism of maintenance-free and low-maintenance plain bearing materials is based on wear. The sliding distance s can therefore be determined from a diagram as a function of the specific load p , *Figure 4*.

In the case of plain bearing materials requiring maintenance, the failure mechanism is based on material fatigue. An estimate of the sliding distance cannot therefore be made in the case of steel/steel and steel/bronze sliding contact surfaces.

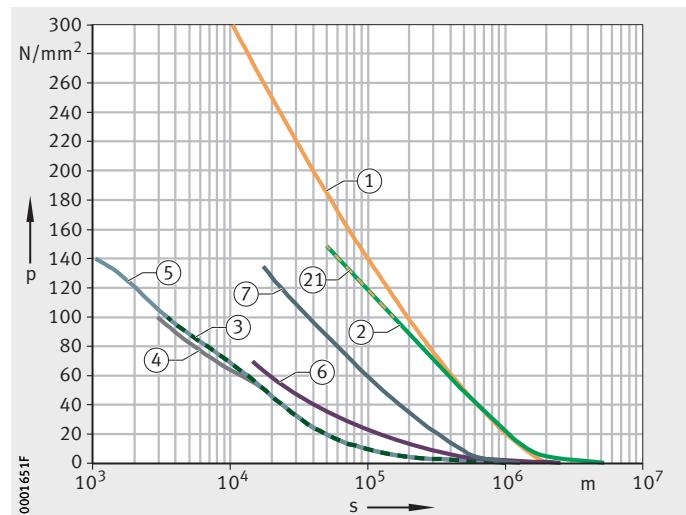

The achievable sliding distance applies if all other factors influencing the rating life are assumed to be ideal.

p = specific load
 s = sliding distance

Selection of the correct plain bearing

Predimensioning

In the case of spherical plain bearings, predimensioning can be carried out in order to estimate the bearing size.

Predimensioning of the bearing size is carried out on the basis of:

- the ratio C/P
 - basic load rating C, see dimension tables
 - bearing load P, see HG 1, Plain Bearings
- the type of load (alternating or unilateral)
- the magnitude of the load
- the bearing series.

The ratio C_r/P or C_a/P is dependent on the series and must not be < 1 .

Predimensioning for spherical plain bearings is not a substitute for more extensive bearing calculation.

For calculation of the rating life L_h in operating hours or oscillations taking account of the operating data applicable to the application, the rating life calculation method is available for almost all products, see HG 1, Plain bearings.

Maintenance-free spherical plain bearings

Guide values for C_r/P or C_a/P are used in conjunction with the diagram for preselection of the bearing size for maintenance-free spherical plain bearings under dynamic load, see table and *Figure 5*, page 15.

Selection of the correct plain bearing

Spherical plain bearings requiring maintenance

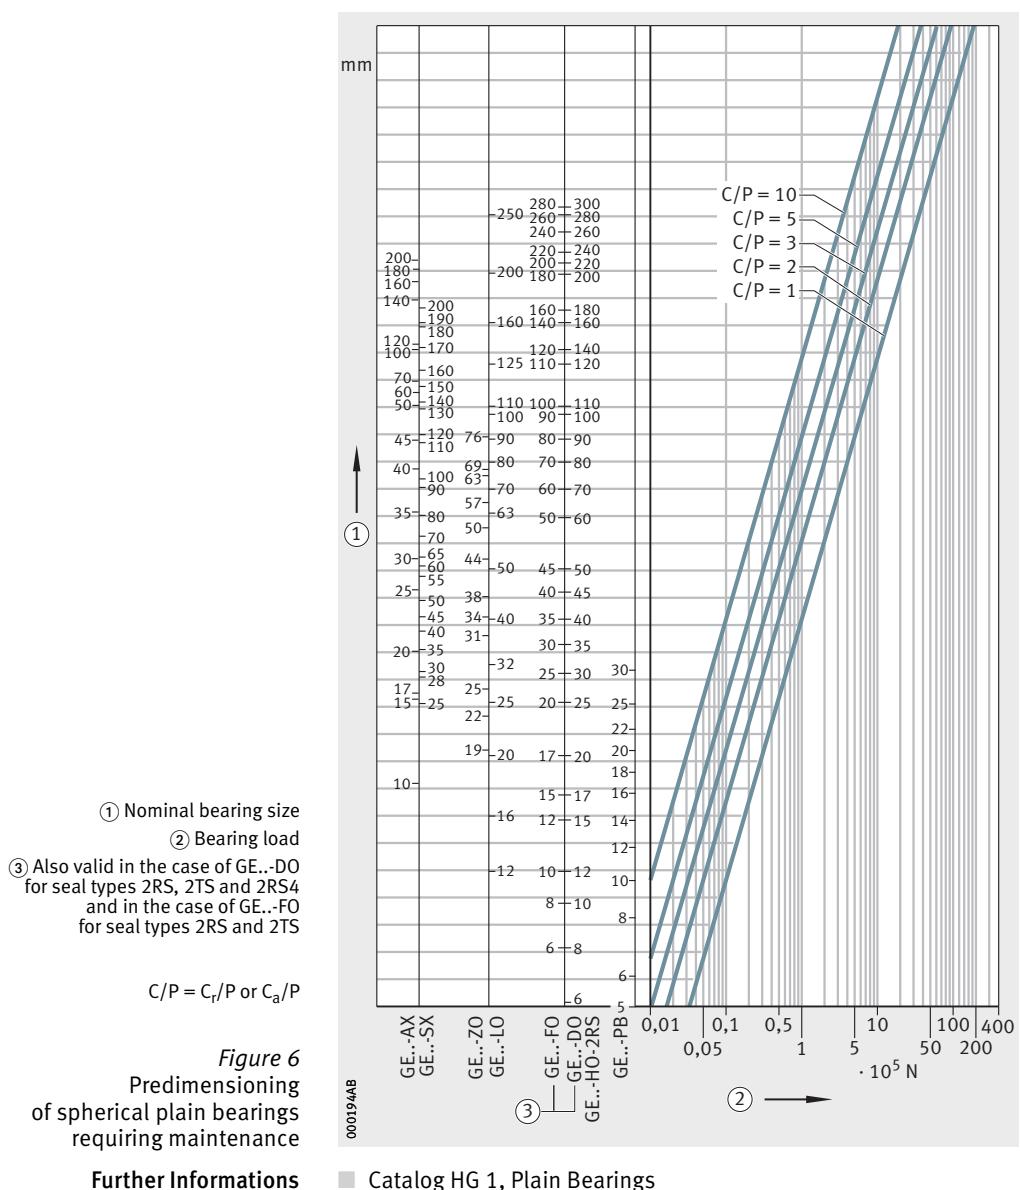

If the basic dynamic load rating C_r or C_a is utilised to the full, there is often a considerable reduction in the operating life of the bearings. The degree to which the basic load rating is utilised should therefore always be matched to the required operating life.

Guide values for C_r/P or C_a/P are used in conjunction with the diagram for preselection of the bearing size for spherical plain bearings requiring maintenance under dynamic load, see table and *Figure 6*, page 17.

Spherical plain bearings, maintenance-free

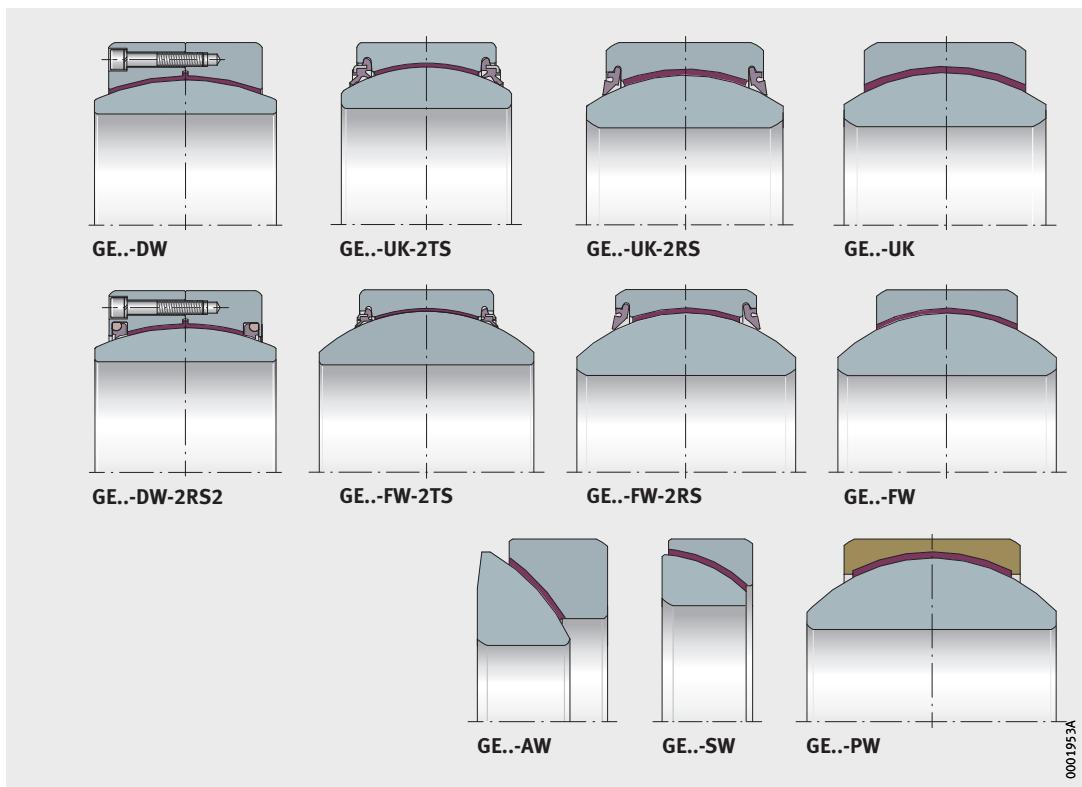

..... 22

Spherical plain bearings are ready-to-fit, standardised machine elements. Due to the outer ring with its concave inner slideway and the inner ring with its curved outer slideway, they can perform spatial adjustment motions.

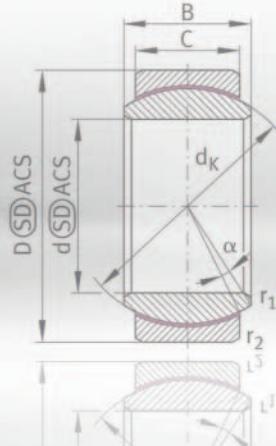

The bearings are available as radial and axial spherical plain bearings. They can support static loads, are suitable for tilt and swivel motion, compensate for shaft misalignment, are not subject to edge stresses under misalignment and allow substantial manufacturing tolerances in the adjacent construction.

These spherical plain bearings are completely maintenance-free. They are used where particular requirements for operating life apply in conjunction with maintenance-free operation or where, for reasons of lubrication, bearings with metallic sliding contact surfaces are not suitable, for example under unilateral load.

The standard sliding layer used is ELGOGLIDE.

Spherical plain bearings, maintenance-free

Features	Spherical plain bearings allow spatial adjustment movements and, depending on the bearing type, can support radial, combined or axial loads.
Radial spherical plain bearings	<p>Maintenance-free radial spherical plain bearings comprise inner rings, outer rings and maintenance-free sliding layers. The inner rings have a cylindrical bore with a curved outer slideway. The outer rings have a cylindrical outside surface and a concave inner slideway.</p> <p>Between the inner and outer ring is an ELGOGLIDE sliding surface. The sliding surface in the series GE..-UK and GE..-FW is PTFE composite, while the sliding surface in series GE..-PW is PTFE film. For a description of the sliding surfaces, see page 28.</p> <p>The bearings are available in open and sealed designs.</p>
Area of application	Radial spherical plain bearings are preferably used to support radial forces. GE..-UK-2RS(-2TS), GE..-FW-2RS(-2TS), GE..-DW and GE..-DW-2RS2 are also suitable for alternating loads up to a contact pressure of $p = 150 \text{ N/mm}^2$. The bearings are used where particular requirements for operating life apply in conjunction with maintenance-free operation or where, for reasons of lubrication, bearings with metallic sliding contact surfaces are not suitable, for example under unilateral load.
X-life	<p>Large radial spherical plain bearings GE..-DW and GE..-DW-2RS2 of $d \geq 320 \text{ mm}$ are X-life bearings and are indicated as such in the dimension tables.</p> <p>These bearings have even higher performance materials, lower coefficients of friction and lower running-in wear than comparable bearings.</p>
Split outer ring	<p>In series GE..-UK-2RS(-2TS) up to a diameter $d \leq 140 \text{ mm}$, the outer ring is axially split at one point, while for diameters $d \geq 160 \text{ mm}$ it is axially split at two points and held together by means of heavy-section retaining washers.</p> <p>In the case of bearings GE..-FW-2RS(-2TS) up to a diameter $d \leq 120 \text{ mm}$, the outer ring is axially split at one point, while for diameters $d \geq 140 \text{ mm}$ it is axially split at two points and held together by means of heavy-section retaining washers. In the case of GE..-DW and GE..-DW-2RS2, the outer ring is radially split. It is held together by means of screws and dowel pins.</p>
Extended inner rings	GE..-FW-2RS(-2TS) and GE..-FW have extended inner rings. As a result, larger tilt angles are possible.

Series, sliding layer, standard	Radial spherical plain bearings are designed according to their specific series with different sliding layers, see table and section Sliding layers, page 28.					
Series and design						
Series	Sliding layer	DIN ISO	Dimension series	Shaft d mm	over	incl.
GE..-UK-2RS	ELGOGLIDE	12240-1	E	17	300	
GE..-UK-2TS	ELGOGLIDE	12240-1	E	30	300

GE..-UK	PTFE composite	12240-1	E	6	30	
GE..-FW	PTFE composite	12240-1	G	6	25	
GE..-PW	PTFE film	12240-1	K	6	30	

Angular contact spherical plain bearings						
	Angular contact spherical plain bearings GE..-SW correspond to DIN ISO 12240-2. They have inner rings with a curved outer slideway and outer rings with a concave inner slideway to which the sliding layer ELGOGLIDE is attached by adhesive.					
	The bearings are available for shaft diameters from 25 mm to 200 mm. Other sizes are available by agreement.					

Area of application						
	The bearings can support radial and axial loads and are suitable for alternating dynamic loads. They can be used in paired arrangements as preloaded units.					
	Angular contact spherical plain bearings are used to support high loads occurring in conjunction with small motions. They are a good plain bearing alternative to tapered roller bearings 320..-X in accordance with ISO 355 and DIN 720, since they have the same mounting dimensions.					

Axial spherical plain bearings						
	Axial spherical plain bearings GE..-AW correspond to DIN ISO 12240-3. In these units, the shaft locating washer is supported in the ball socket-shaped sliding zone of the housing locating washer.					
	The sliding material in the housing locating washer is ELGOGLIDE or, in the case of a nominal diameter $d \geq 220$ mm, ELGOGLIDE in X-life.					
	The bearings are available for shaft diameters from 10 mm to 360 mm. Other sizes are available by agreement.					

Area of application						
	The bearings are preferably used to support axial forces. They are suitable as support or base bearings and can also be combined with radial spherical plain bearings of dimension series E in accordance with DIN ISO 12240-1.					

X-life						
	Axial spherical plain bearings GE..-AW of $d \geq 220$ mm are X-life bearings and are indicated as such in the dimension tables.					
	These bearings have even higher performance materials, lower coefficients of friction and lower running-in wear than comparable bearings.					

Spherical plain bearings, maintenance-free

Sliding layers

Maintenance-free spherical plain bearings have special sliding layers based on polytetrafluorethylene PTFE in the outer ring.

In descending order of performance capability, these are:

- ELGOGLIDE, the highest performance sliding layer
- ELGOGLIDE-W11, the sliding layer for low friction
- PTFE film
- PTFE composite.

These materials form the slideway, transmit the forces occurring and perform the lubrication function.

Maintenance-free bearings must not be lubricated.

ELGOGLIDE

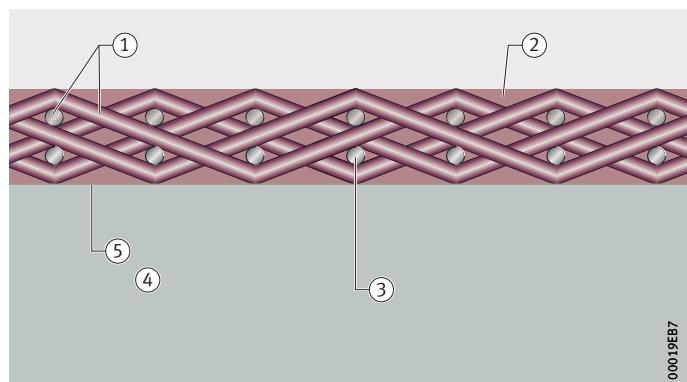

The sliding layer comprises a 0,5 mm thick layer of ELGOGLIDE, is embedded in synthetic resin and attached by a high strength bond to the support body, *Figure 1*.

The flow behaviour of the sliding layer is, in conjunction with the supporting body, almost negligible even under very high load. The adhesive bond is resistant to moisture and swelling.

ELGOGLIDE is a registered trademark and product of Schaeffler.

- ① PTFE fabric,

② Resin matrix
③ Support fibres
④ Steel supporting body
⑤ Adhesive bond

Figure 1
ELGOGLIDE,
maintenance-free
plain bearing material

ELGOGLIDE designs

For differing requirements, the following are available:

- ELGOGLIDE
the standard material for very high dynamic contact pressures from 25 N/mm² to 300 N/mm² and a long operating life
- ELGOGLIDE-W11
the material for dynamic contact pressures from 1 N/mm² to 150 N/mm² and with low coefficients of friction even at low contact pressures.

The operating limits of the plain bearing materials must be observed, see page 11.

PTFE film The PTFE film (metal fabric material) is fixed to the outer ring curved surface, *Figure 2*.

The metal fabric is made from high strength bronze and acts as a stabiliser for the sintered PTFE composite.

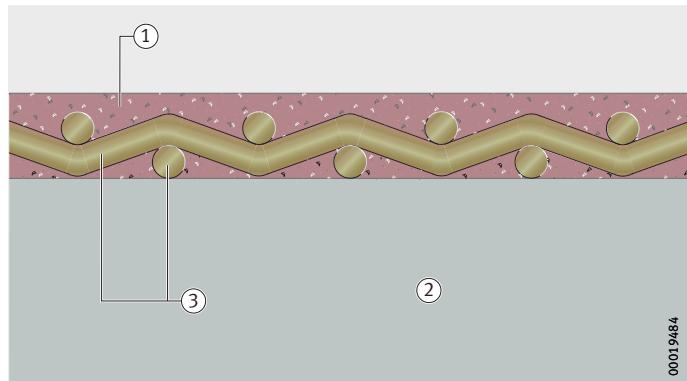

Figure 2
PTFE film, cross-section

00019484

PTFE composite

PTFE composite comprises sheet steel with bronze attached by sintering and an embedded plastic composite made from PTFE, *Figure 3*.

The composite is embedded with form fit between the inner ring curved surface and the outer steel surface.

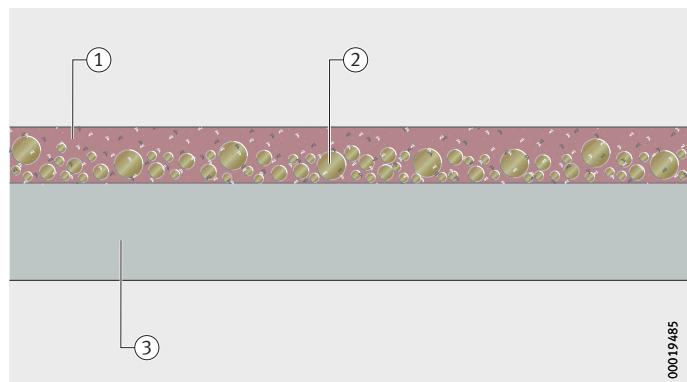

Figure 3
PTFE composite, cross-section

00019485

Spherical plain bearings, maintenance-free

Bearing materials

Maintenance-free spherical plain bearings fulfil all the requirements in terms of fatigue and wear resistance, hardness, toughness and structural stability as well as maintenance-free operation.

The materials used for the inner and outer rings and the shaft and housing locating washers are generally hardened and ground rolling bearing steel, see table.

Materials and design

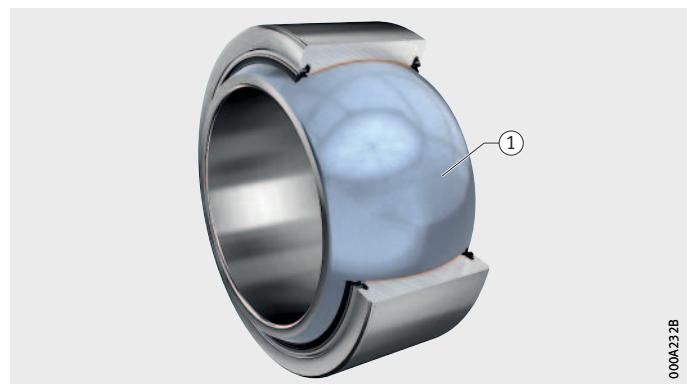

Series	Material	
	Inner ring or shaft locating washer	Outer ring or housing locating washer
GE..-UK-2RS GE..-UK-2TS GE..-FW-2RS GE..-FW-2TS	Hardened and ground rolling bearing steel, curved surface finished or polished (from $d \geq 240$ mm) and Durotect CMT coated.	Axially split at one point in GE..-UK-2RS(-2TS) to $d \leq 140$ mm and in GE..-FW-2RS(-2TS) to $d \leq 120$ mm. In larger sizes, axially split at two points and held together by means of heavy-section retaining washers on the outside diameter. ELGOGLIDE fixed by adhesive in the outer ring curved surface.
GE..-DW GE..-DW-2RS2	Hardened rolling bearing steel, curved surface ground, polished and Durotect CMT coated.	42CrMo4-TQ in accordance with DIN EN 10083-1, radially split and held together by means of screws and dowel pins arranged axially on one side. ELGOGLIDE fixed by adhesive in the outer ring curved surface.
GE..-UK GE..-FW	Hardened rolling bearing steel, curved surface finished and Durotect CMT coated.	Formed around inner ring by special upset process from two bushes pushed into each other, outer steel surface subsequently precision machined. PTFE composite embedded with form contact between the inner ring curved surface and the outer steel surface.
GE..-PW	Hardened and ground rolling bearing steel, curved surface finished.	Brass, formed about inner ring, outside surface subsequently precision machined. PTFE film fixed by adhesive in the outer ring curved surface.
GE..-SW GE..-AW	Hardened rolling bearing steel, curved surface ground, polished and Durotect CMT coated.	Outer ring in GE..-SW and housing locating washer in GE..-AW made from hardened rolling bearing steel. Curved surface ground, in the case of GE..-AW ≥ 160 mm, housing locating washer made from unhardened steel. ELGOGLIDE fixed by adhesive in the outer ring or housing locating washer curved surface.

spherical plain bearings
in excavator

Sealing	Sealed radial spherical plain bearings have the suffix 2RS, 2RS2 or 2TS. They are protected by lip seals on both sides against contaminants and water spray. Large radial spherical plain bearings GE..-DW-2RS2 have seals with increased sealing action for very high requirements. Radial spherical plain bearings GE..-UK-2TS and GE..-FW-2TS are sealed on both sides by integrated, triple lip high performance seals. Angular contact and axial spherical plain bearings are not sealed but can be protected by means of an external seal, see HG 1, Plain Bearings.
Lubrication	Maintenance-free spherical plain bearings do not have relubrication facilities and must not be lubricated.  Maintenance-free spherical plain bearings must be subjected to dry running-in. Any lubricant will impair the smoothing effect necessary and will considerably reduce the operating life of the bearings.

Spherical plain bearings, maintenance-free

Operating temperature

The permissible operating temperature is dependent on the sliding contact surface and the sealing arrangement, see table.

If the temperature exceeds the stated values, there will be a reduction in the operating life and the effect of the sealing arrangement.

Operating temperature

Series	Temperature °C	
	over	incl.
GE..-UK	-50	+200
GE..-UK-2RS ¹⁾	-30	+130
GE..-UK-2TS ¹⁾	-30	+100
GE..-DW	-50	+150
GE..-DW-2RS ²⁾	-40	+120
GE..-FW	-50	+200
GE..-FW-2RS ¹⁾	-30	+130
GE..-FW-2TS ¹⁾	-30	+100
GE..-PW	-50	+200
GE..-SW	-50	+150
GE..-AW	-50	+150

¹⁾ Due to the different sliding layers in the series, see table, page 27, these bearings are suitable, if they are used without seals, for temperatures from -50 °C to +150 °C.

Temperature-resistant seals

If sealed bearings must be used at higher temperatures, an unsealed bearing with external, temperature-resistant seals can be used, *Figure 6*.

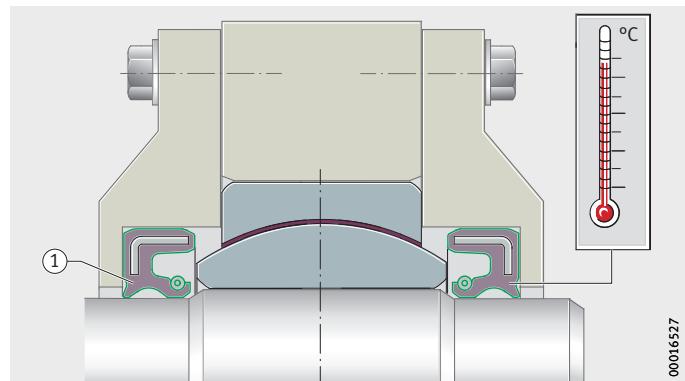

Figure 6

with external seals

Suffixes

Suffixes for available designs: see table.

Available designs	Suffix	Description	Design
Standard	2RS	Standard lip seals on both sides	Standard
	2RS2	Double lip seals with increased sealing action on both sides	
	2RS4	Triple lip seals with increased sealing action on both sides	
	2TS	Triple lip high performance seals on both sides with steel reinforcement for applications with high contamination	
Special design, available by agreement only	W1	Inner and outer ring made from corrosion-resistant steel	Special design, available by agreement only
	W3	Inner ring made from corrosion-resistant steel	
	W7	Inner ring bore with ELGOGLIDE lining; inside diameter d reduced by 1,08 mm ($d_{\text{NEW}} = d - 1,08$)	
	W8	Inner ring bore with ELGOGLIDE lining; inside diameter d remains in accordance with nominal diameter ($d_{\text{NEW}} = d$)	
	W11	For low contact pressures (starting as low as 1 N/mm ²) and minimal friction	
	G8	Outer ring with Corrotect ZN ¹⁾ coating, curved and end surfaces of inner ring with Durotect CMT coating	

¹⁾ Other surface coatings are available by agreement.

Rod ends

Maintenance-free

Rod ends

Rod ends, maintenance-free 54

Maintenance-free rod ends comprise a housing with integral shank and a maintenance-free spherical plain bearing. The integral shank has an internal or external thread. The spherical plain bearing is firmly seated and located in the housing. The housings and shanks are protected against corrosion by a zinc coating.

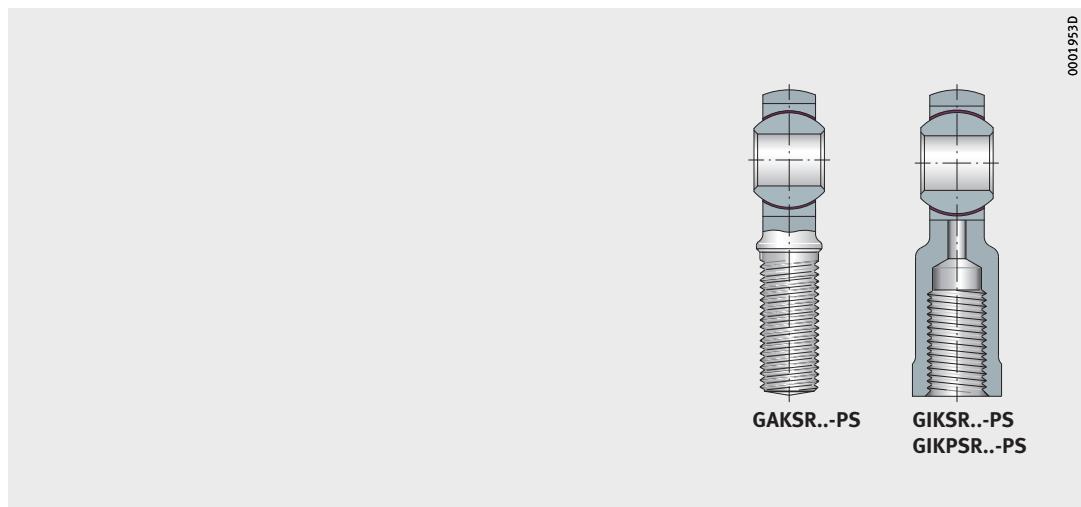

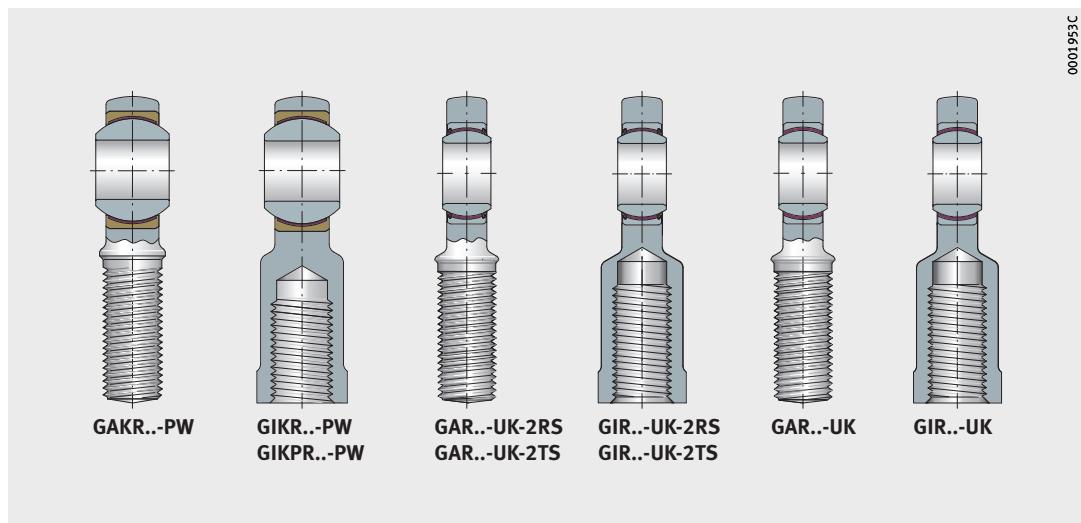

The rod ends can support radial loads in a tensile or compressive direction. They are suitable for slow movements with small to moderate swivel angles, for unilateral load and under certain conditions for alternating loads (also suitable for alternating loads with GE..-UK-2RS). Sealed rod ends have lip seals on both sides and are thus protected against contamination and water spray.

Corrosion-resistant rod ends, maintenance-free 54

Corrosion-resistant rod ends made from high-grade steel correspond in their construction to the maintenance-free rod ends but are of a corrosion-resistant design.

The preferred areas of application include machinery for the food and drink industry, butchery machines, the chemical industry and medical equipment. The products have also proven effective in aircraft and ship building as well as for applications in buses and rail vehicles.

Rod ends with CETOP mounting dimensions are often used in control and automation engineering.

Rod ends, maintenance-free

Features	Maintenance-free rod ends and maintenance-free corrosion-resistant rod ends comprise a housing with integral shank and a maintenance-free spherical plain bearing. The shank has an internal or external thread, the spherical plain bearing is firmly seated and located in the housing. The rod ends are available in open designs and in designs sealed on both sides. The housings and shanks are protected against corrosion by a zinc coating. The sliding layer between the inner ring and outer ring is PTFE composite, ELGOGLIDE or PTFE film, see page 28.
Area of application	Maintenance-free rod ends can support radial loads in a tensile or compressive direction. They are particularly suitable for slow movements with small to moderate swivel angles and unilateral loads. For alternating loads, rod ends with bearings of series GE..-UK-2RS(-2TS) and GE..-FW-2RS(-2TS) can be used.
Dimension series E	Rod ends to DIN ISO 12240-4, dimension series E incorporate radial spherical plain bearings GE..-UK or GE..-UK-2RS(-2TS) and have a right or left internal or external thread, <i>Figure 1</i> . The sliding contact surfaces are hard chromium/PTFE composite or hard chromium/ELGOGLIDE. The thin walled design of the eye housing allows compact adjacent constructions. These rod ends are also available by agreement with radial spherical plain bearings GE..-FW or GE..-FW-2RS(-2TS) of dimension series G.

Dimension series K

Rod ends to DIN ISO 12240-4, dimension series K incorporate radial spherical plain bearings GE..-PW and have a right hand or left hand internal or external thread, *Figure 2*. The sliding contact surface is steel/PTFE film.

- ① With internal thread
- ② With external thread

Figure 2
Rod ends,
dimension series K

Corrosion-resistant rod ends

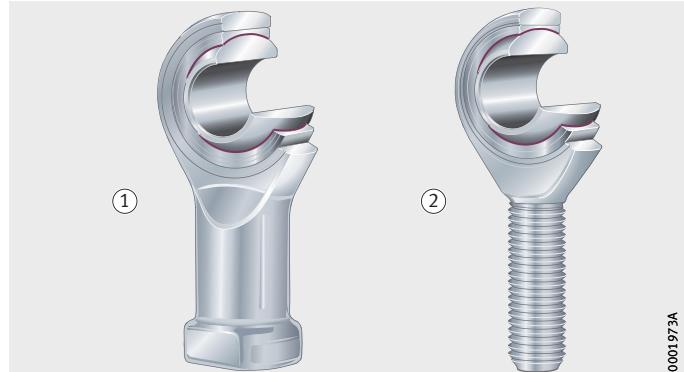

Corrosion-resistant rod ends to DIN ISO 12240-4, dimension series K incorporate radial spherical plain bearings GE..-PS and have a right hand or left hand internal or external thread, *Figure 3*. The sliding contact surface comprises corrosion-resistant steel and corrosion-resistant PTFE film attached to the curved outer ring surface.

The housing and shank has a thread to DIN 13 and the diameter range extends from 5 mm to 30 mm. The bore tolerance of the spherical plain bearings is H7 \oplus .

Corrosion-resistant rod ends with an internal thread are also available with CETOP mounting dimensions to ISO 8139 for pneumatic cylinders. These are used in preference in control and automation engineering.

Materials	Maintenance-free rod ends fulfil all the requirements in terms of fatigue and wear resistance, hardness, toughness and structural stability as well as maintenance-free operation. Maintenance-free rod ends are manufactured from drop forged quenched and tempered steel C45 QT in accordance with DIN EN 10083-2 and have a zinc coated surface. Corrosion-resistant rod ends have an inner ring made from a corrosion-resistant steel such as X105CrMo17. The outer ring and the housing are made from X8CrNiS18-9. Alternative materials are permissible.
Sealing	Sealed rod ends of dimension series E have the suffix 2RS or 2TS. They are protected by lip seals on both sides against contaminants and water spray. Rod ends GIR..-UK-2TS, GIL..-UK-2TS, GAR..-UK-2TS and GAL..-UK-2TS are sealed on both sides by integrated, triple lip high performance seals. Rod ends of dimension series K are not sealed.
Lubrication	<p>During the running-in phase, PTFE particles are transferred from the sliding layer to the opposing running surface. As a result, the small roughness features of the inner ring surface are filled in. It is only once this tribologically smooth surface is produced in conjunction with the detached PTFE particles that the bearings can achieve a long operating life.</p> <p> Maintenance-free rod ends do not have relubrication facilities and must not be lubricated.</p> <p>Any lubrication of maintenance-free rod ends after dry running-in will impair the smoothing effect necessary and will considerably reduce the operating life of the bearings.</p>

Rod ends, maintenance-free

Operating temperature

The permissible operating temperature is dependent on the sliding contact surface and the sealing arrangement, see table.

If the temperature exceeds the stated values, there will be a reduction in the operating life and the effect of the sealing arrangement.

At temperatures below 0 °C, a reduction in the load carrying capacity of the rod ends must be taken into consideration.

1) For a left hand thread, the R in the designation is replaced by an L, for example GIL17-UK-2RS.

2) The values for the tilt angle α are subject to tolerances.

3) Basic load rating of housing.

Attention!

In the case of rod ends with $d \geq 25$ mm and the sliding material ELGOGLIDE,
the basic static load rating C_{0r} of the rod end is lower than the basic dynamic load rating C_r of the bearing.

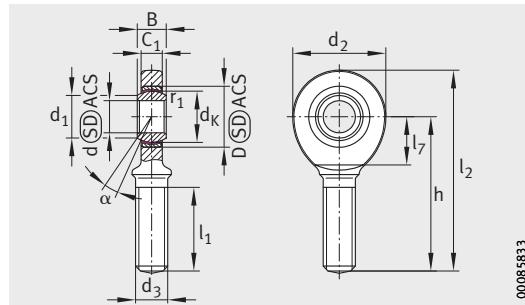

4) This differs from DIN ISO 12240-4, dimension series E.

5) Thread runout or thread groove at manufacturer's discretion.

Corrosion-resistant rod ends

With external thread, maintenance-free
 DIN ISO 12240-4, dimension series K, type M
 Corrosion-resistant
 Open design

GAKSR..-PS
 PTFE film

000B71CB

Dimension table · Dimensions in mm

¹⁾ For a left hand thread, the R in the designation is replaced by an L, for example GAKSL5-PS.

²⁾ The values for the tilt angle α are subject to tolerances.

³⁾ Basic load rating of housing.

⁴⁾ This differs from DIN ISO 12240-4, dimension series K.

Chamfer dimension							Basic load ratings		Radial internal clearance ⁴⁾
